Car Care Prototype App

Shawn Singharaj
Group 27

CS 352 Final Presentation

Project Introduction and Target Audience

The Car Maintenance App addresses the lack of a reliable, one-stop application for tracking vehicle maintenance tailored to specific car models, age, and mileage.

Currently, car owners rely on fragmented methods like:
- Sticky notes
- Spreadsheets
-Physical receipts

This leads to missed service intervals, reduced vehicle lifespan, and financial anxiety.

Our target audience spans the entire spectrum of car owners: from financially conscious DIY enthusiasts to novices who rely on dealerships, with extra focus on those managing vehicles where preventative care is critical to longevity.

Heuristic: Visibility of System Status

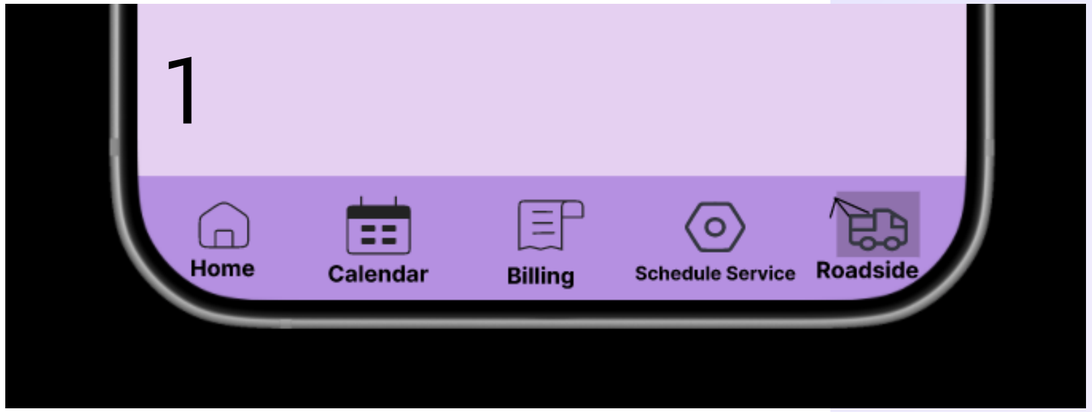
1. **Home screen health overview:** Immediately shows car status and urgent issues so the user always knows the current system state.

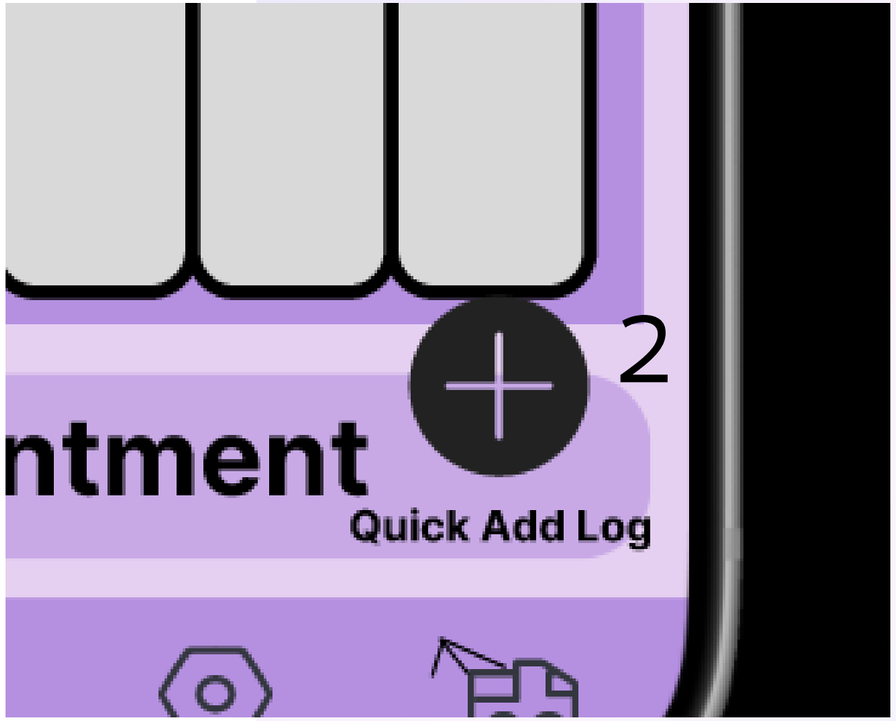
2. **Notifications overlay:** Alerts the user to active issues and provides quick navigation to address them.

Heuristic: Match Between System and the Real World

1. **Maintenance timeline and vehicle manual:** Uses familiar concepts like timelines, manuals, and servicing schedules that mirror real-world car maintenance.

2. **Map of service shops with reviews:** Reflects real-world behavior of locating nearby mechanics and evaluating them before scheduling.

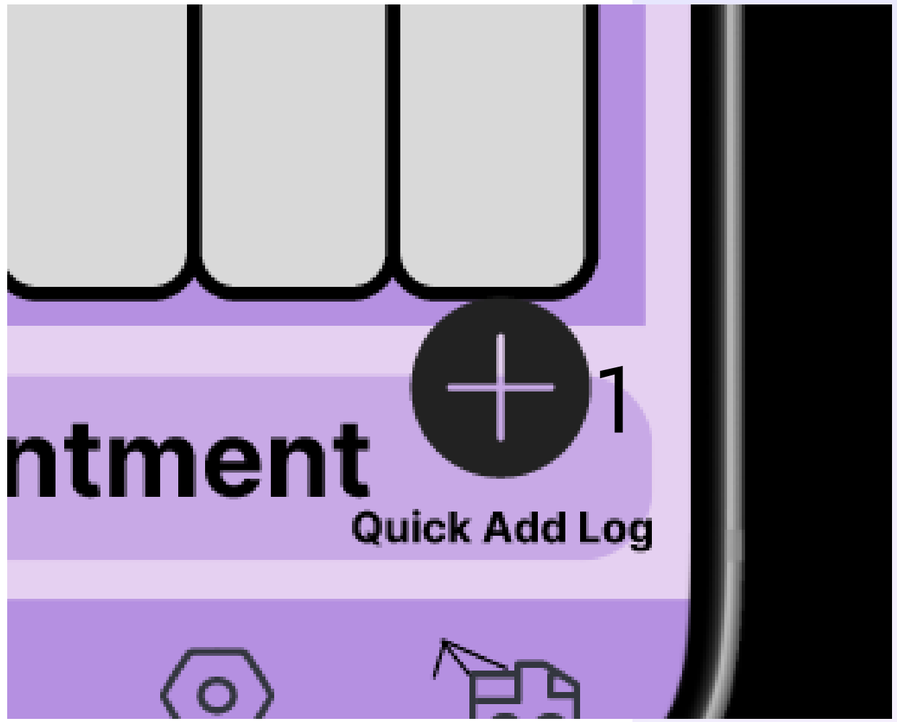


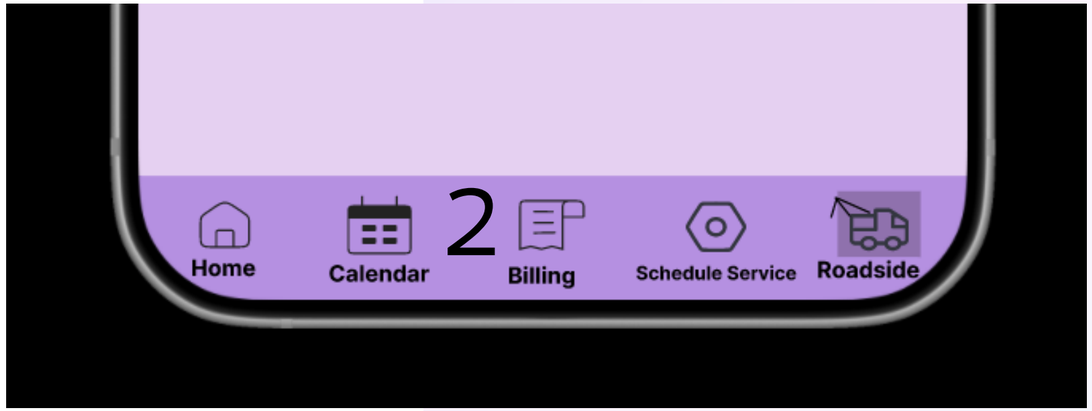


Heuristic: User Control and Freedom

1. **Navigation bar available on every screen:** Allows users to freely move between sections without being locked into a flow.

2. **Quick Add service popup:** Users can quickly add maintenance records from anywhere and return to the log.

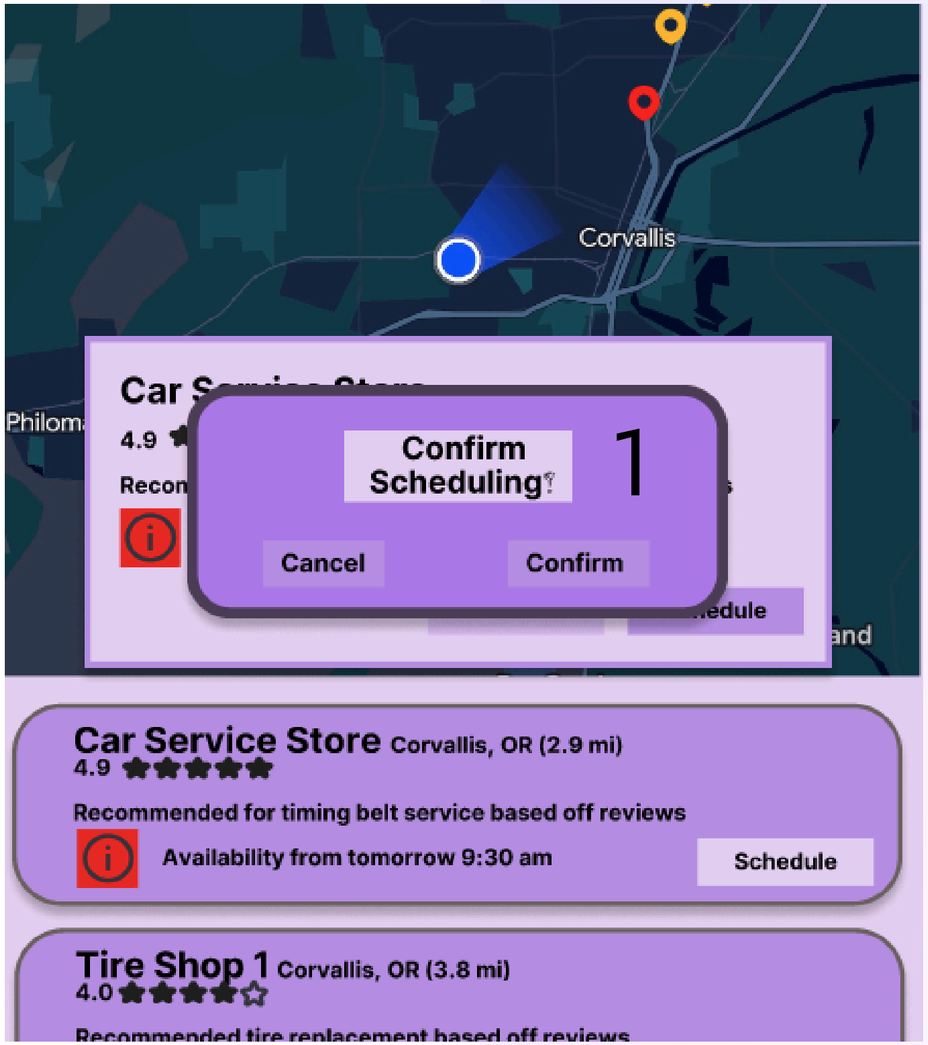




Heuristic: Consistency and Standards

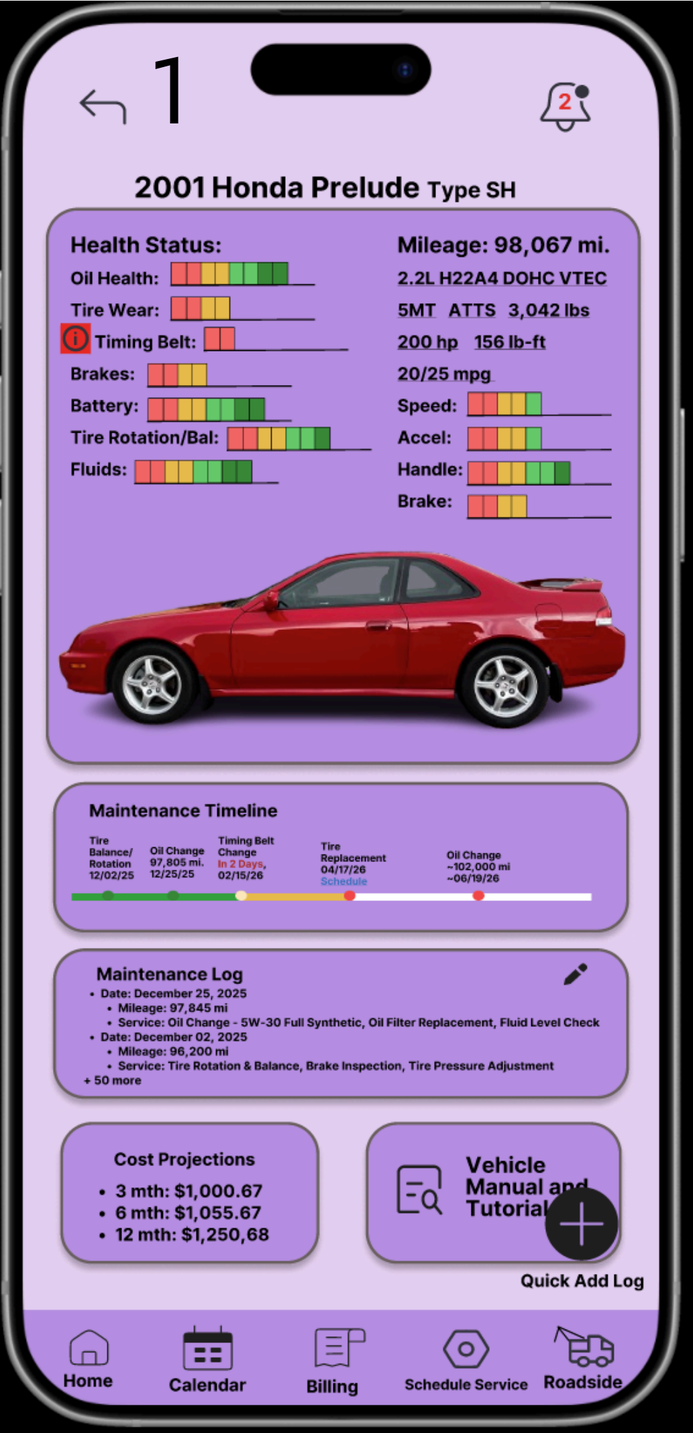
1. **Floating action button for adding services:** Uses a common mobile UI pattern that users already understand.

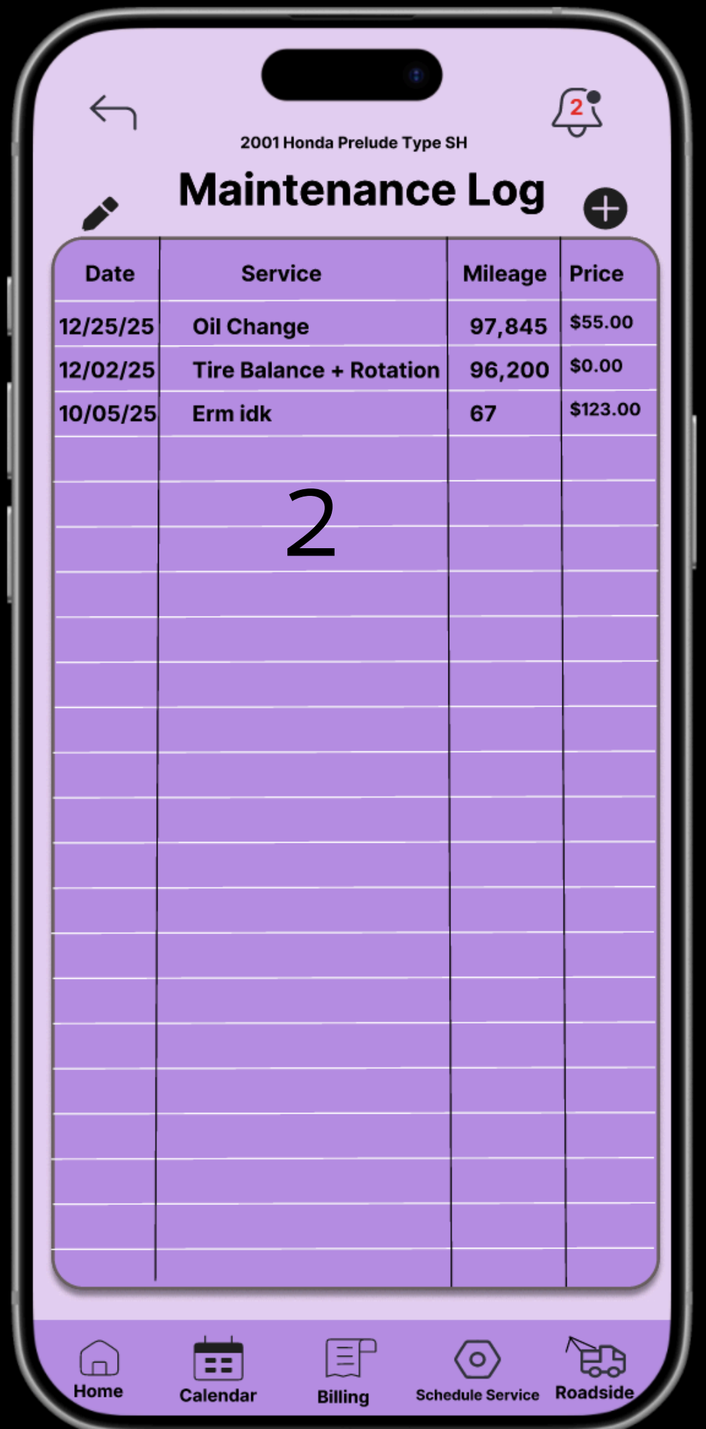
2. **Standard navigation bar icons:** Keeps navigation predictable and aligned with common app interface conventions.



Heuristic: Error Prevention

1. **Confirmation prompts before submitting inputs:** Prevents accidental data entry or unintended actions.

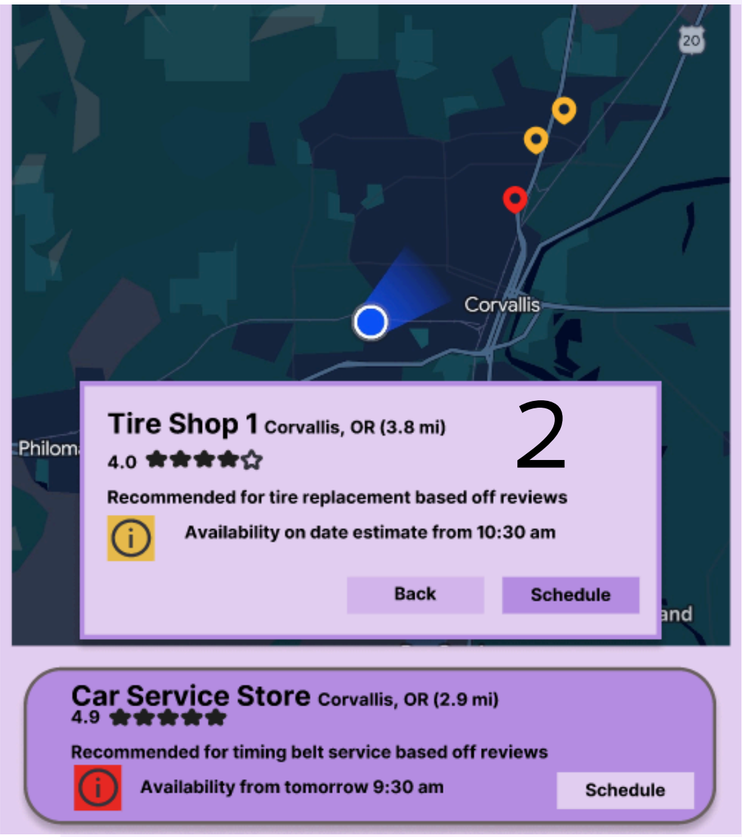




Heuristic: Recognition Rather Than Recall

1. **Visual vehicle health representation:** Lets users recognize maintenance needs visually instead of remembering technical details.

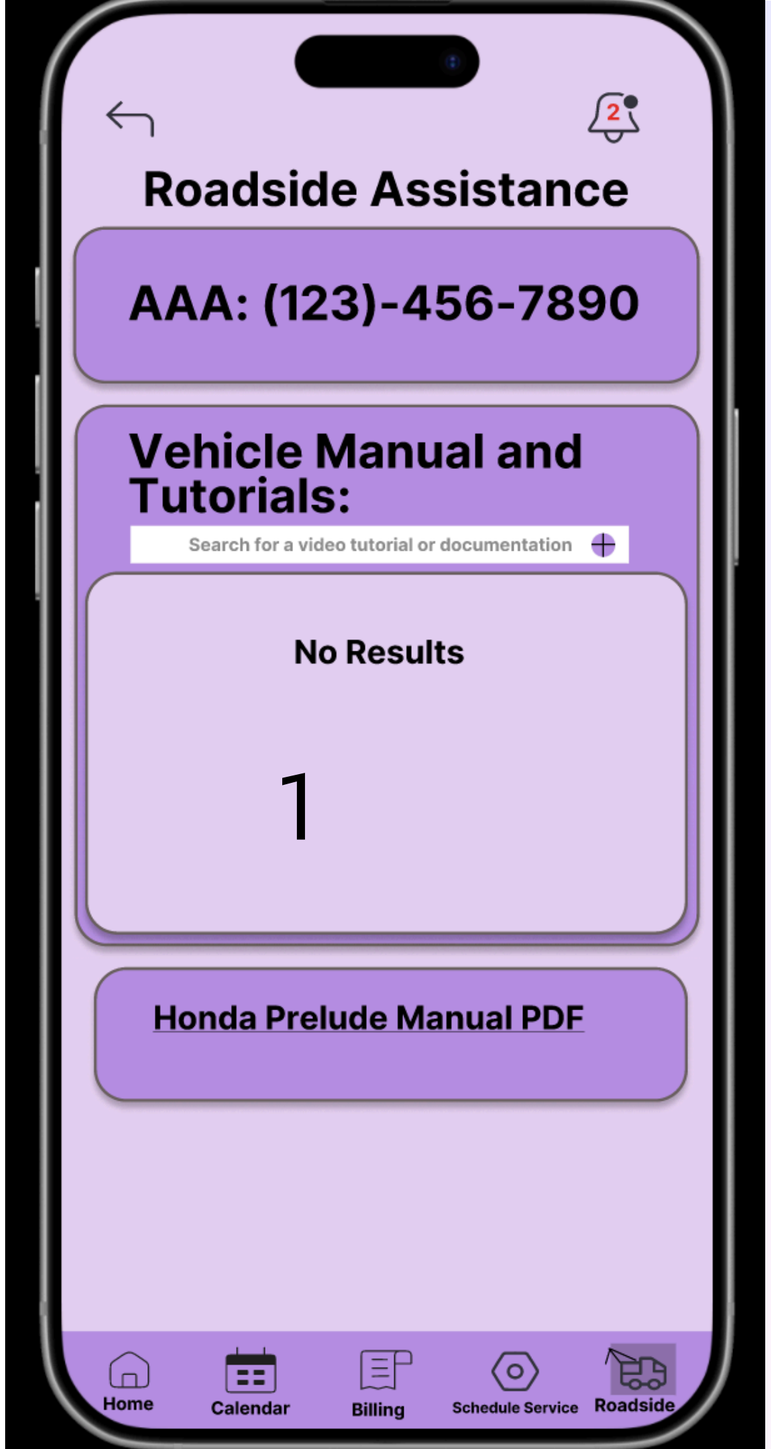
2. **Maintenance log and timeline:** Displays history and upcoming tasks so users don’t need to remember past service events.



Heuristic: Aesthetic and Minimalist Design

1. **Home screen showing only basic and urgent health information:** Reduces clutter by prioritizing essential vehicle data. All buttons and boxes are properly spaced.

2. **Popup details for shops and logs:** Keeps the interface clean while allowing deeper information when needed.



Heuristic: Help and Documentation

1. **Vehicle manual, tutorials, and documentation:** Provides accessible resources for understanding maintenance tasks and troubleshooting.
